

MORE ON RECURSION

Problem Solving with Computers-I

C++

```
#include <iostream>
using namespace std;

int main(){
    cout<<"Hola Facebook!";
    return 0;
}
```

Last class: *this is legal!*

```
int fac(int N) {  
    return N * fac(N-1) ;  
}
```

legal != recommended

```
int fac(int N) {  
    return N * fac(N-1) ;  
}
```

No *base case* -- the calls to **fac** will never stop (nicely)!

Make sure you have a
base case, *then* worry
about the recursion...

```
int fac(int N) {  
    return fac(N) ;  
}
```

Roadsigns and recursion

examples of self-fulfilling danger

Thinking recursively !

```
int fac(int N) {
```

```
    if (N <= 1)  
        return 1;
```

} Base case

```
}
```

Thinking recursively !

```
int fac(int N) {  
    if (N <= 1) } Base case  
        return 1;  
  
    else{  
        int rest = fac(N-1) ; } Recursive  
        return rest * N; } case  
    }
```

Human: Base case and 1 step

Computer: Everything else

Thinking recursively !

```
int fac(int N) {  
    if (N <= 1)           } Base case  
        return 1;  
  
    else  
        return fac(N-1) * N; } Recursive case  
                                (shorter version)  
}
```

Human: Base case and 1 step

Computer: Everything else

Behind the curtain...

```
int fac(int N){  
    if (N <= 1)  
        → return 1;  
    else  
        return N * fac(N-1);  
}
```

```
cout<<fac(1);
```

Result: 1

The base case is **No Problem!**

Behind the curtain...

```
int fac(int N){  
    if (N <= 1)  
        return 1;  
  
    else  
        return N * fac(N-1);  
}
```

fac(5)

Behind the curtain...

```
int fac(int N){  
    if (N <= 1)  
        return 1;  
  
    else  
        return N * fac(N-1);  
}
```

fac(5)

5 * fac(4)

Behind the curtain...

```
int fac(int N){  
    if (N <= 1)  
        return 1;  
  
    else  
        return N * fac(N-1);  
}
```

fac(5)

int fac(int N){  
    if (N <= 1)  
        return 1;  
  
    else  
        return N * fac(N-1);  
}
```

fac(5)

5 * 24

Behind the curtain...

```
int fac(int N){  
    if (N <= 1)  
        return 1;  
  
    else  
        return N * fac(N-1);  
}
```

fac(5)

Result: 120

Let recursion do the work for you.

Exploit self-similarity	}	Less work !
Produce short, elegant code		

Let recursion do the work for you.

Exploit self-similarity
Produce short, elegant code

} **Less work !**

```
int fac(int N) {  
    if (N <= 1)  
        return 1;
```

You handle the base case –
the easiest case!

```
else{
```

Recursion does almost all of
the rest of the problem!

```
    int rest = fac(N-1);
```

You specify one
step at the end

```
    return rest * N;
```

```
}
```

But you ***do*** need to do one step yourself...

```
int fac(int N) {  
    if (N <= 1)  
        return 1;  
    else:  
        return fac(N) ;  
}
```

This will not work !

Searching a linked list

Given a linked list, implement a recursive search function

- Return True if a given value is present in the list
- Otherwise return False

Recursive function to free nodes in a linked list

Given a linked list, implement a recursive function to delete all the nodes in the linked list

Fibonacci series

- Write a program to return the nth term of the fibonacci series
1, 1, 2, 3, 5, 8, 13, 21,....

Binary Search: Efficient search in a sorted array

- **Binary search.** Given `value` and sorted array `a[]`, find index `i` such that `a[i] = value`, or report that no such index exists.
- **Invariant.** Algorithm maintains $a[lo] \leq value \leq a[hi]$.
- Ex. Binary search for 33.

[illegible]
